Attribute Data Origin

This map reflects the various sources of attribute data compiled for the National Vegetation Information System (NVIS) Version 4.2 Estimated Pre-1750 Vegetation.

Attribute data complements the spatial data in the NVIS, providing detailed vegetation information for each polygon. Current state and territory NVIS data are the preferred source. Older NVIS data are sometimes used where a state or territory has not provided data for a new version. Gap-filling is usually carried out by the Commonwealth as a temporary solution where there are no NVIS data available.

The NVIS is an ongoing collaborative initiative and future improvements to the NVIS database are planned.
